A. Introductory and General Remarks

programme of the Russians at WOLFEN just after the war [redacted] listed the following as having been moved:-

the dismantling

25X1

25X1

- (a) The "Stabilisator arlage" (S.T. arlage)
- (b) The "Phosgene arlage"
- (c) The "Linde arlage" (oxygen and nitrogen part)
- (d) "Gipschwefel saure arlage"
- (e) The "Metchrome farbstoff arlage"
- (f) The "Vanillin arlage"
- (g) The "Sulphur black arlage"
- (h) "Dinitro anisone arlage"
- (i) "Hydrochinon arlage"
- (j) Miscellaneous and laboratory equipment, such as small autoclave plant, laboratory size, drying ovens and table motors, microscopes and half the laboratory. Also removed were some of the autoclaves in the bisol plant, the paranitraniline and orthonitraniline and other small plant.

25X1

There were besides quite a number of items of copper and silver equipment such as distillation columns from the perfume plant; these were broken up on arrival.

2. [redacted] there may originally have been an intention of reconstructing the plants as they were originally dismantled but that the intention was not fulfilled and the plants were, so far as he knew, all rotting away on dumps. German PWs. who handled such items of plant took good care to sabotage them whenever they could and also invariably delicate equipment was broken. When the materials were handled by Russians more often than not owing to clumsiness the same results were achieved. It is interesting to note that the plant and equipment at WOLFEN when dismantled and packed was marked with the destination to which it was being sent in Russia.

25X1

(Note [redacted] This was entirely in contradistinction to normal Russian practice in these matters.)

C. Notes on Work of Specialist Group in RUBESNOYE

1. The German specialists at RUBESNOYE were divided into three categories:

- (a) those who had come direct to RUBESNOYE from Germany, evidently as a result of a specific requirement, to add to their experience or to the advancement of the dyestuffs industry;
- (b) the other group comprised German specialists who had come from other locations and whose subsequent activity was merged with the interest specified in (a) above. It was the common view that they had for the most part been engaged on work of direct defence application and were being otherwise occupied in order that they might conveniently forget their previous work while it might possibly be developed further by the Russians.

2. It was evident that the Russian urge to use the Germans was rather unplanned and the requirements not very well-defined. It seemed that the Russians were adopting a somewhat empiric approach by throwing a lot of knowledgeable foreigners together in the hope that something useful might come out of it.

3. The organisation which actually sponsored them was actually NIOPIK. This was the contracted title of the State Scientific Laboratory for Organic Dyes and Intermediates. NIOPIK was an independent development combine or trust, charged with the responsibility for research and development of dyestuffs and intermediates and was a research organisation and clearing house of information obtained from all over the world. While the production aspect was covered by a separate complex of factories the NIOPIK organisation at RUBESNOYE, together with other filiale at KEMEROVO(?) and, possibly, also at SLAVYANSK, came under NIOPIK, MOSCOW. The whole system was merged in a large State Trust,

SECRET

25X1

~~SECRET~~

25X1

called GLAVANILPROM. The production and research interests jointly involved in this came under the Ministry of Chemical Industry.

4. It should, however, be noted that where matters of plant design were concerned, the main organisation responsible for initial pilot-planting and development of process plant, was GLAVANILPROM, which also maintained a department at RUBEINOYE. Questions on installation of plant were discussed between the representatives of this organisation and the technical management of the KHIM KOMBINAT itself. The full name of the factory at RUBEINOYE was KHIM KOMBINAT IMENI K.A. VOROSHILOVA.

5. Originally, the German specialists were engrafted on to the NIOPIK organisation and were fully administered by the chemical Kombinat itself, then although engaged on NIOPIK work the specialists went "through" the factory to the Ministry of Chemical Industry. Later, in order to improve the direction of the programme, to avoid administrative difficulties which tended to involve the factory in NIOPIK affairs and also, perhaps, to obtain credit for MOSCOW headquarters, the whole group became more directly administered by MOSCOW coming under NIOPIK headquarters; these changes took place in 1947.

6. Although the NIOPIK organisation had some say in the setting of priorities for development of products they often had the utmost difficulty in obtaining materials. This in part perhaps originated in the very sharp divisions of responsibility in Russian organisations in the extreme rigidity in Russian planning. Such planning has considerable advantages in that the tight system of delivery dates and strict penalties for non-fulfilment were very necessary in Russia, where the national character is both evasive and supine. The disadvantages are also very great when it is necessary to show a degree of flexibility in handling unforeseen situations which arise all too often in the chemical industry.

7. The character of the work and the personalities involved in it are briefly shown in the attached table. It will be seen that the programme divides itself roughly into the following heads:-

- (a) Intermediates of Azo and vat dyestuffs
- (b) Thio indigo
- (c) Indanthrene
- (d) Naphthol A.S. dyestuffs
- (e) Triphenylmethane dyestuffs
- (f) Fur dyes
- (g) Indicators
- (h) Textile chemicals
- (i) Insecticides
- (j) Para-amino Salicylic acid
- (k) Analytical chemistry
- (l) Physics
- (m) High pressure research (organic syntheses - dyestuffs and intermediates)
- (n) Catalysts
- (o) Engineering - Plant development connected with projected syntheses
- (p) Miscellaneous projects such as electro-technical syntheses of hydrazobenzol using sodium amalgam.

(Note: Annexe 2. This illustrates the form under which the work of the group on different projects was headed on presentation to the Ministry in MOSCOW).

25X1

SECRET

25X1

[redacted] the documentation of research and engineering projects undertaken by or on behalf of the Russians is unbelievably full by Western, or at least, by German standards.

25X1

8. A perfectly simple item of research which in Germany would probably express itself in a short laboratory report of, perhaps, ten pages, would be elaborated into quite a large treatise. This stress on report writing tended to slow up research work and was one reason why the Germans were comparatively unproductive at RUBESJOE. There were, of course, in addition, frequent difficulties which threatened to impede the work and affect the possibility of achieving the work plan. In such an event there were continual consultations in which all reasons for failure were aired. On the whole, however, such problems yielded to slow pertinacity, which eventually brought about ultimate success. In spite of indifferent and impure raw materials or intermediate products which always seemed to vary from their specifications and also the delays due to defective work arising from the inadequate practical knowledge of the Russian chemists.

9. Another source of trouble from the Russians was the complete isolation of the Germans from the production and material on a semi-technical or pilot plant scale. This work was done in a technical laboratory, and was carried out by the Russian chemists who had assisted in the development of the process in a laboratory. The progress of such work often held great surprises, quite often the actual preliminaries of the semi-scale production of pilot batches of a new colour, which was to be made in a series of reactions involving kilogramme charges rather than gramme charges, were well understood by the German chemists. They did not, however, have access to pilot plant and were unable to control the quality of raw materials. The Russians would run into difficulties and then would come in say, four to six weeks for advice. The chemist of the Works Manager would come with troubled expressions and very reserved.

"The process devised by you cannot be put into practice."

25X1

"Why not?" [redacted]

"We get the end product in small quantities and bad quality."

Inquiry by the Germans and eventual concessions on the part of the Russians would eventually show that the raw materials were unsuitable and in some essential particulars the plant was not being operated correctly. Eventually, after the proper standards of material had been achieved and correct limits for process variables observed there would be a success. This would be hailed by much excitement and acclaim in the Works' paper, the "LENINSKY PRIZYV". There would be a Works meeting in which the achievements of works' personnel would be praised and bonuses awarded to the Works' chemist, who would undoubtedly have been incapable of making the dye on his own. This situation was a typical one which was repeated over and over again. If it was not brought about by the circumstances above, it could be brought about by a distortion of the recommendations made by the German chemists through incorrect translation of particulars or irresponsible alteration or adaptation of plant specifications by Russian staff.

F. Tabulated Summary of Dyestuffs and Pigments  
in Production or projected at RUBESNOYE

Appended is a list of dyes and pigments produced or about to be produced i.e. in course of development at RUBESNOYE. The Russian and German designations are given, together with the characteristic SCHULTZ and Colour Index numbers which obtain as would be derived by reference to SCHULTZ JULIUS Dyestuff tables.

Very many of these products are, of course, German ones taken from WOLFEN, LUDWIGSHAFEN or LEVERKUSEN. Sometimes when no appropriate German equivalent is shown it means that the dye has been of little interest in Germany and has been allowed to lapse.

The range shown does, however, tend to off-set the disparaging remarks made about the Russian dyestuffs industry by all returns seen so far, since there would appear to be a fair range of products developed largely without the benefit of German superior wisdom.

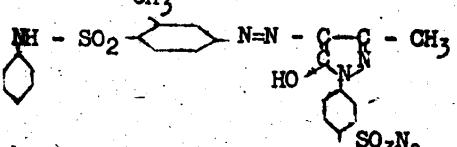

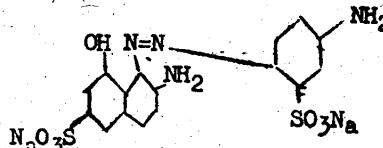

Acid Dyestuffs
